

Aluwood

Installation guide

WOOD  UPP

Aluwood panels

Aluwood outdoor panels are powder coated durable exterior cladding panels designed for outdoor use. They combine thermally modified solid wood with the strength and weather resistance of aluminium, making them suitable for facades, fences, and decorative exterior walls.

Products

All products are standard 2400 mm long

Aluwood - Brown

Aluwood - Oiled Brown

Aluwood - Black

Aluwood - Grey

Aluwood - Alu (No wood)

Coverage

All products are standard 2400 mm long

Outside corner p. 14

Inside corner p. 15

Bottom / divider - p. 16-17

Insect screen - p. 18

Wall crown 200 mm p. 19

Wall crown 250 mm - p. 19

End profile - p. 20

Top profile p. 21

Window sill - p. 22

Coverage - p. 23 / 24

Mounting materials

**Aluwood back
screws**

**Aluwood front
screws**
(mounting on wood)

**Aluwood front
screws**
(mounting on steel / aluminium)

Recommended fitting

Suitable WRB
(Weather Resistant
Barrier)

**Battens/Furring
Strips**

Recommended tools & materials

Folding rule

Pencil/marker

Level

Power drill

T20 Torx Bit Driver

Circular saw

Utility knife

Metal snips

Recommended safety information

Wear protective gloves and safety glasses during installation

Use proper lifting techniques when handling panels

Follow all local building codes and regulations

Do not install panels in extreme weather conditions (heavy rain, strong wind)

Recommended installation

Step 1:

Install battens/furring strips horizontally

Note the bottom edge of the panel has a 15 degree slope for runoff.

Install battens/furring strips vertically (optional)

Battens should be evenly spaced approx. 80 cm between.

Make cuts if necessary for proper panel and or trim fitment

6x
SKU7926 screws

IMPORTANT! Be sure to securely fasten the slats to the aluminium from the backside along any cut areas.

Screw 1 cm from cutline.

Step 2: Placing the start trims and first panels

- Install any needed "starter" trim along bottom and side edge so that panels will be on top of the trim to aid in keeping moisture out.

Example!

- Start with side trim and suggested direction is from right to left, but both is possible. (left side with tongue, right side without tongue, one goes on top of the other).

- Position the panel and check for plumbness using a level.
- Make sure screws are aligned with rear battens.
- Secure the panel to the battens/furring strips with the mounting screws leaving out screws along edge where adjacent panel will overlap.
- Do not overtighten screws — Keep screws straight and tighten just enough to seal the rubber washer.
- Install adjacent panels by overlapping the previously installed panel and checking vertical alignment frequently for perpendicularity.

Step 3: Finishing

- Inspect all attachment points and proper panel overlapping.

Example!

Installation application details

Option 1: Outside corner:

Installation application details

Option 2: Inside corner:

This piece can also be used to join a wall and ceiling.

Installation application details

Option 3: Bottom trim / divider:

TIP

It is preferable to leave a space under the bottom water drip to facilitate water drainage and prevent stagnation between the wall and the bottom.

The bottom piece can also provide strategic extra centimeters. The panels can be installed up to 7 cm above the water drainage flap.

Installation application details

Option 10: Divider trim / bottom:

Installation application details

Option 4: Insect screen:

TIP

This insect screen device is highly recommended for installation on buildings residential houses. Not necessary on sheds, fences, and simple walls, and installation without rear battens.
